

Chain Rule Assignment

1. Given $f(z) = \log_e(1+z)$ where $z = x^T x$, $x \in \mathbb{R}^d$

$$\Rightarrow \text{if } x = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_d \end{bmatrix} \text{ then, } x^T = [x_1 \ x_2 \ \dots \ x_d]$$

$$x^T x = [x_1^2 + x_2^2 + \dots + x_d^2]$$

Applying chain rule,

$$\begin{aligned} \frac{df}{dx} &= \frac{df}{dz} \cdot \frac{dz}{dx} \\ &= \frac{d}{dz} (\log(1+z)) \cdot \frac{d}{dx} (x^T x) \\ &= \frac{1}{1+z} \cdot \frac{d}{dz} (z) \cdot \frac{d}{dx} (x_1^2 + x_2^2 + \dots + x_d^2) \\ &= \frac{1}{1+z} (2x_1 + 2x_2 + \dots + 2x_d) \\ &= \frac{1}{1+z} \cdot 2 (x_1 + x_2 + \dots + x_d) \\ &= \frac{2}{1+z} \sum_{i=1}^d x_i \quad (\text{Ans}) \end{aligned}$$

2. $f(z) = e^{-\frac{z}{2}}$; where $z = g(y)$, $g(y) = y^T S^{-1} y$, $y = h(x)$,

$$h(x) = x - \mu$$

\Rightarrow Using chain rule,

$$\frac{df}{dx} = \frac{df}{dz} \cdot \frac{dz}{dy} \cdot \frac{dy}{dx}$$

$$\text{here, } \frac{df}{dz} = \frac{d}{dz} (e^{-\frac{z}{2}}) = -\frac{e^{-\frac{z}{2}}}{2}$$

$$\frac{dz}{dy} = \frac{d}{dy} (y^T S^{-1} y)$$

$$= \lim_{h \rightarrow 0} \frac{g(y+h) - g(y)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(y+h)^T S^{-1} (y+h) - y^T S^{-1} y}{h}$$

$$= \lim_{h \rightarrow 0} \frac{(y^T S^{-1} + h S^{-1})(y+h) - y^T S^{-1} y}{h}$$

$$= \lim_{h \rightarrow 0} \frac{y^T S^{-1} y + y^T S^{-1} h + h S^{-1} y + h^2 S^{-1} y}{h}$$

$$= \lim_{h \rightarrow 0} \frac{h(y^T S^{-1} + S^{-1} y + h S^{-1})}{h}$$

$$= \lim_{h \rightarrow 0} (y^T S^{-1} + S^{-1} y + h S^{-1})$$

$$= y^T S^{-1} + S^{-1} y$$

$$\frac{dy}{dn} = \frac{d(n-1)}{dn} = 1$$

$$\therefore \frac{df}{dn} = \frac{df}{dz} \cdot \frac{dz}{dy} \cdot \frac{dy}{dn}$$

$$= - \frac{e^{-\frac{z}{2}}}{2} (y^T S^{-1} + S^{-1} y) \cdot 1$$

$$= - \frac{e^{-\frac{z}{2}}}{2} \cdot \frac{1}{S} (y^T + y) \quad (\text{Ans})$$
